Course Title: EGT 234: Machine Design

Course Leader: Stephanie Rittler

Expected Learning Outcomes for Course:

Upon successful completion of the course, students will be able to do the following:

- Understand stress concentration, failure theories, and cyclic loading
- Apply Mohr’s circle to failure theories
- Apply failure theories to stressed parts
- Work with principle stresses
- Design shafts
- Select and analyze springs
- Select and analyze fasteners
- Size power transmission threads
- Calculate loads on clutches and brakes
- Analyze welded and riveted connections
- Analyze gear trains

It is expected that 80% of the students enrolled in this course will complete the MET program and be employed in a related field or continue their education.

Assessment:
(How do students demonstrate achievement of these outcomes?)

Four exams, homework assignments

Validation:
(What methods are used to validate your assessment?)

Feedback from internship employers.

Results:
(What does the data show?)

Students struggle with quite a few concepts in this course due to a lack of example problems in their textbook.

Follow-up:
(How have you used the data to improve student learning?)

More example problems are worked through during class and students work together in teams to solve problems. Also, step-by-step homework solutions are posted on Blackboard once homework is turned in.

Budget Justification:
(What resources are necessary to improve student learning?) N/A
