

Course Outcomes Guide (COG)

Course Title: EGR 103 Introduction to Engineering Design

Update Date: 5/1/2019

Course Team: Ed Sigler

Expected Learning Outcomes

1. Apply knowledge of mathematics, science and engineering to identify, formulate, and solve engineering problems,
2. Design and conduct experiments and analyze and interpret data.
3. Function in multi-disciplinary teams and develop an understanding of group dynamics
4. Develop computer skills including spreadsheets, mathematics software, word processors, graphical presentation software, and engineering drawing software and the use of the internet and online databases for research,
5. Develop basic computer programming skills.
6. Develop an understanding of the role engineers play in our modern society, and engineering ethics.
7. Develop communicate skills including oral, written and visual (engineering drawing).

Assessment

1. Students apply knowledge of mathematics, science, and engineering by the completion of engineering homework problems and the completion of in class exams.
2. Engineering design project requires students to design a robot to complete a specified function, test the design, analyze test data, and modify the design based upon the data generated.
3. Robotics project and Mission to Mars design project are team assignments Students will be evaluated by the instructor and their peers on their ability to work effectively in a team.
4. Students will conduct online research to develop flight components for the mission to mars project. Students will use word processing and presentation software to develop Robot and Mission to Mars final reports and presentation packages. Students will learn and be evaluated on their ability to effectively use CREO Parametric software to generate computer models and generate usable parts for the Robotics project, and the use of MATLAB to solve engineering problems.
5. Students will be evaluated on their computer programming ability during the design project. They will be require to develop, write, and troubleshoot computer programs required to control robot functions.
6. Students are evaluated on their understanding of the role of engineers in society and engineering ethics by the writing of short research papers on the topics.

7. Students interact within the Robotics and the Mission to Mars design project teams where they communicate within their teams. Students prepare a written report detailing development, design and results for both projects. Further, each member of the Mission to Mars teams is required to prepare and present to the class.

Validation

Exams for each section will contain the same questions. Exams will be analyzed to see if students, on average, demonstrate common area of weaknesses.

Projects are assessed against the consistent criteria for each section and semester.

Results

Data from 2013 through Spring 2019 has been analyzed. See Table below.

Major findings for FA 2019

1. The Mission to Mars project was instituted in Fall 2014 and requires students to work in a team, follow the design process and develop group participation skills. The majority of students have provided very positive feedback on the project. The reports in Fall 2019 were lacking in format and content, similar to Spring 2018.
2. A large majority of students have not had basic computer programming in high school. Math workspace software requires significant time and continued re-enforcement through inclusion within other activities.
3. Basic trigonometry and vector mathematics is an issue for some students.
4. Fall 2018 introduced EGR 103 in a hybrid format. It proved difficult to manage the course content and cover required concepts for CREO and MATLAB – labs were forced to cover lecture material – sort of diluting both.

Follow-up

1. The Mission to Mars report format (contained in the Project Description) will be separately provided and amplified. The grading rubric (also contained in the Project Description) will be separately provided and emphasized in the lecture.
2. MATLAB will become a focus for re-enforcement within EGR 103 and other engineering courses. The EGR 103 lab component includes 5 interactive sessions and a final in-class project support session.
3. A trig and vector review has been incorporated into the initial course lectures for review of concepts to assist students as these concepts are fundamental to the solution of many engineering problems. Amplification starting in FA 17 was carried into FA 19 via online material and discussion in the course. Hybrid format prevented additional discussion with the students. Did not seem to be a limited factor for FA 19.
4. Future EGR 103 courses will be converted to lecture only

Course: EGR 103

** - 1 student changed to AU prior to end of class.

*** - Students missed 3 class periods due to snow days. However, material was covered in class with examples and discussions.
